

## G7 Transport Academic Workshop

# Modeling approaches for resilient transport networks

**L. Leclercq\*, A. Furno & co-authors**

\* Univ. Gustave Eiffel

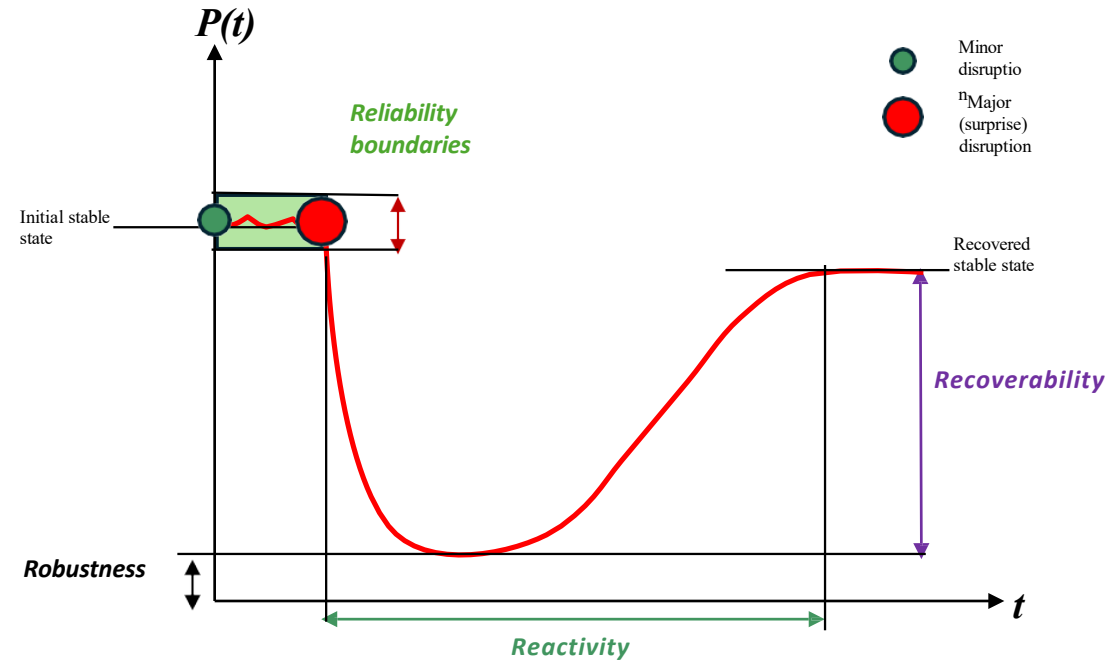

Wednesday, 10<sup>th</sup> April 2024 - Aula Magna "Carassa e Dadda"  
Politecnico di Milano, Bovisa Campus, Milan (Italy)

# Data-driven approaches for assessing urban network resilience

A. Furno, ENTPE / Univ Eiffel

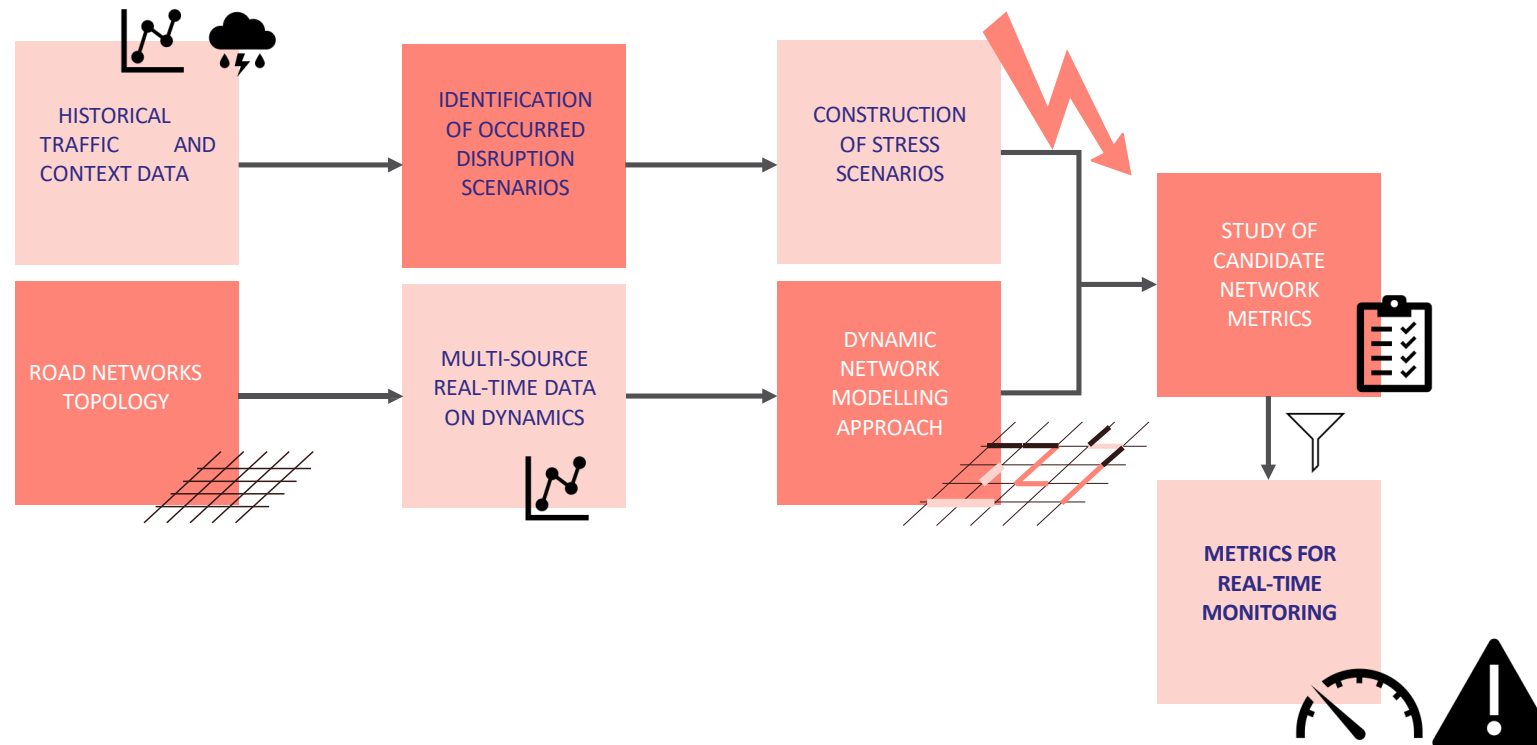

# Resilience of transportation networks

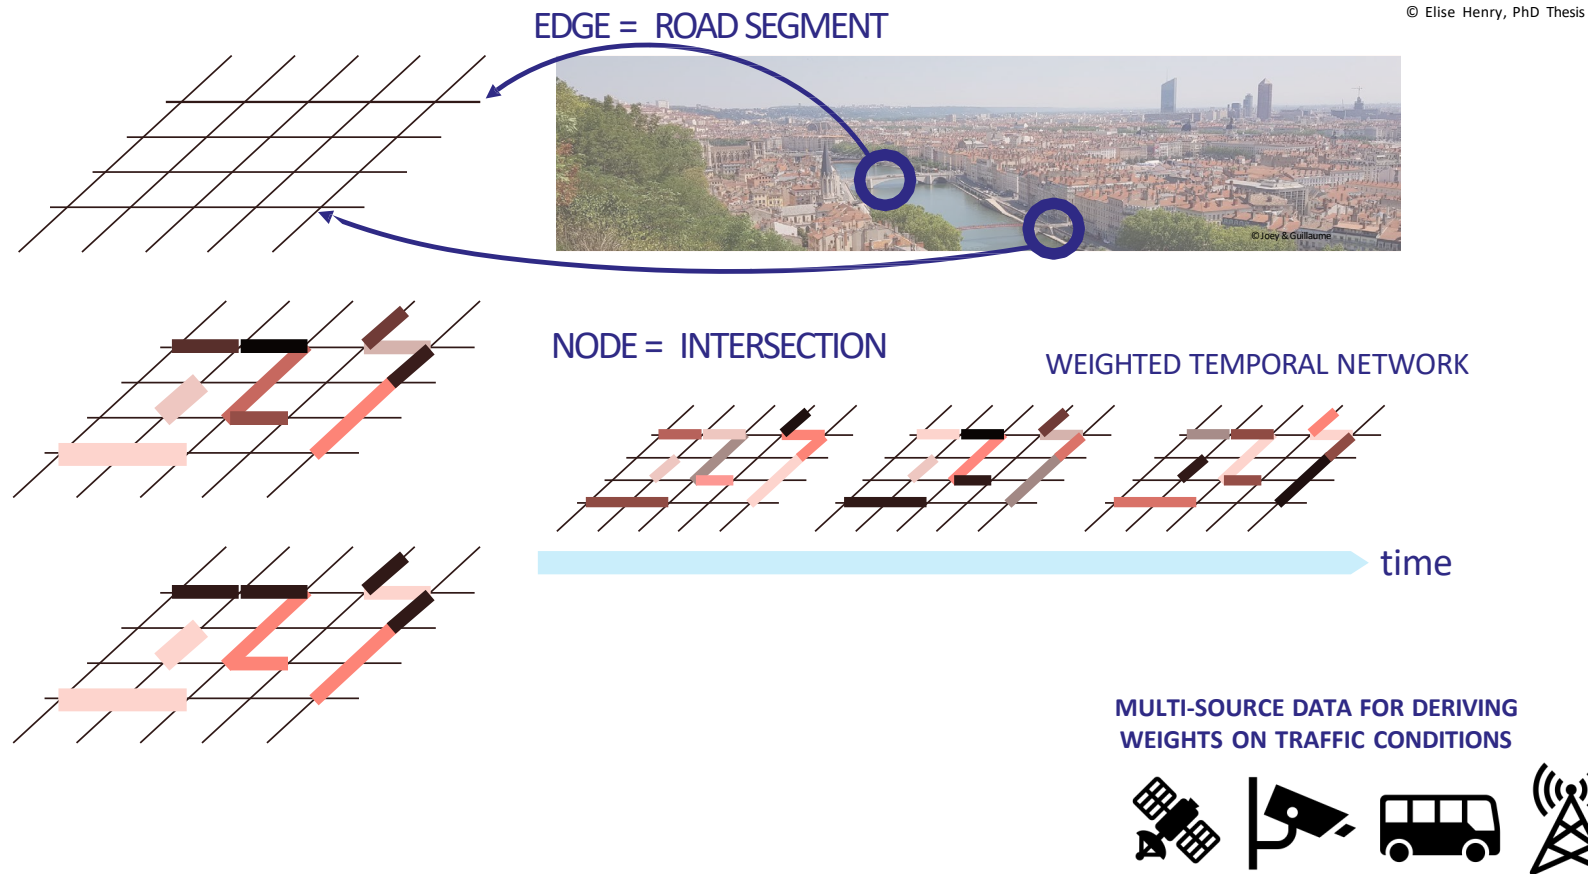

Resilience is a complex term

*Mattsson and Jenelius, 2015: "Vulnerability and resilience of transport systems"*

# Metrics for real-time monitoring

# Graph-based Modelling with Dynamic Urban Data

# Metrics for Network-wide monitoring

  
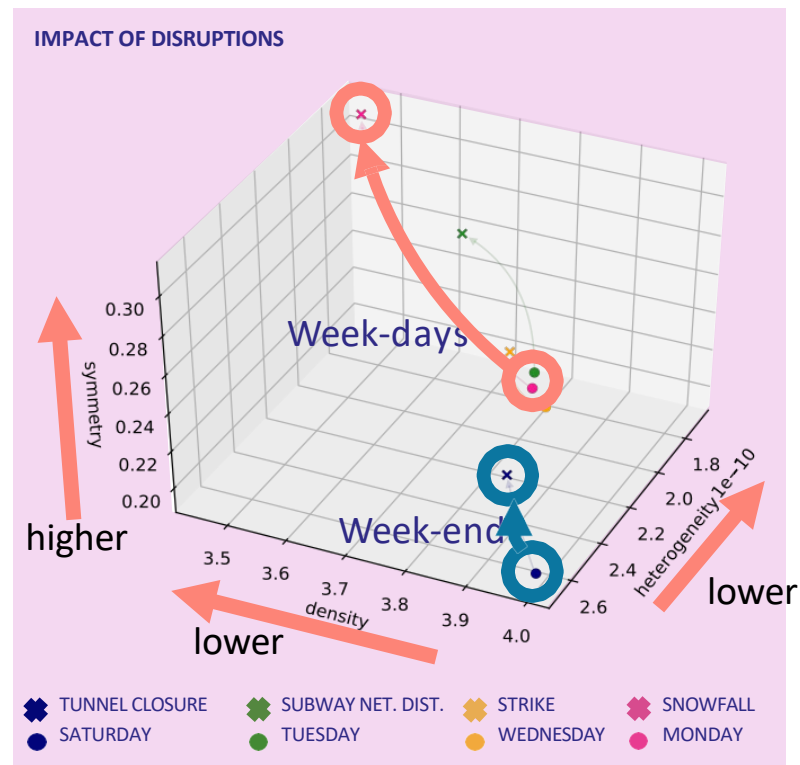

**WEIGHT(e) =**  
**LEVEL OF SERVICE(e)**  
 =  
 $TT(e) / FFTT(e)$

**DENSITY:**  
 AVERAGE DEGREE  
 $\langle k \rangle$

**HETEROGENEITY:**

$$h = \frac{\sigma_{in}\sigma_{out}}{\langle k \rangle}$$

**SYMMETRY:**  
 CORRELATION COEFFICIENT  
 IN-DEGREE & OUT-DEGREE

$$S = \frac{\langle k_{in}k_{out} \rangle - \langle k_{in} \rangle \langle k_{out} \rangle}{\sigma_{in}\sigma_{out}}$$

© Elise Henry, PhD Thesis

# A new modeling framework for multimodal transport systems

# Transportation models

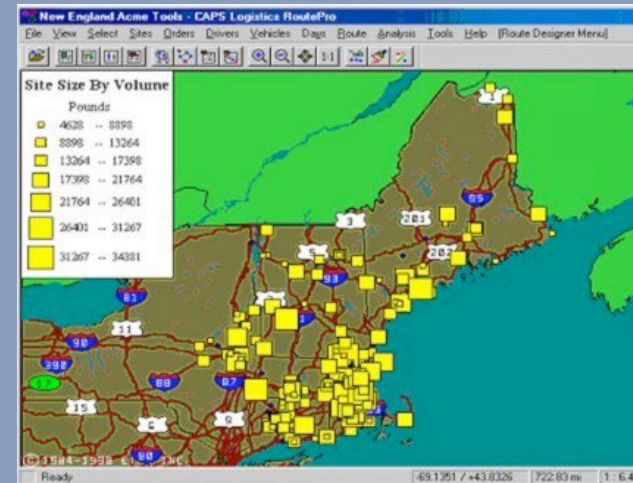

Local traffic dynamics

Open simulation platform (Symuvia)

(Leclercq et al, 2009-2015)

Static model for planing

Room for large-scale dynamic models

# The Macroscopic Fundamental Diagram

FD + Network structure (topology / signal timings) + Route choices = MFD

# Multimodal MFD extension

(a) Production MFD surface.

(b) Velocity MFD surface.

# Trip-based model: event-based formulation

$$\int_{t-T(N_{out}(t))}^t V(n(s)) ds = L$$

(Arnott, 2013)  
(Lamotte & Geroliminis, 2016)  
(Mariotte & Leclercq, 2017)

An event-based numerical scheme

## Advantages

- Direct access to entry and exit times for all individual vehicles
- Efficient numerical scheme as only the next vehicle to exit should be updated in practice at each event
- Straightforward extension to account for heterogeneous travel distances

# Hybrid trip-based model concept

Motion is based on regional speed given by the MFD

Trip calculation are made on the real (multimodal) network

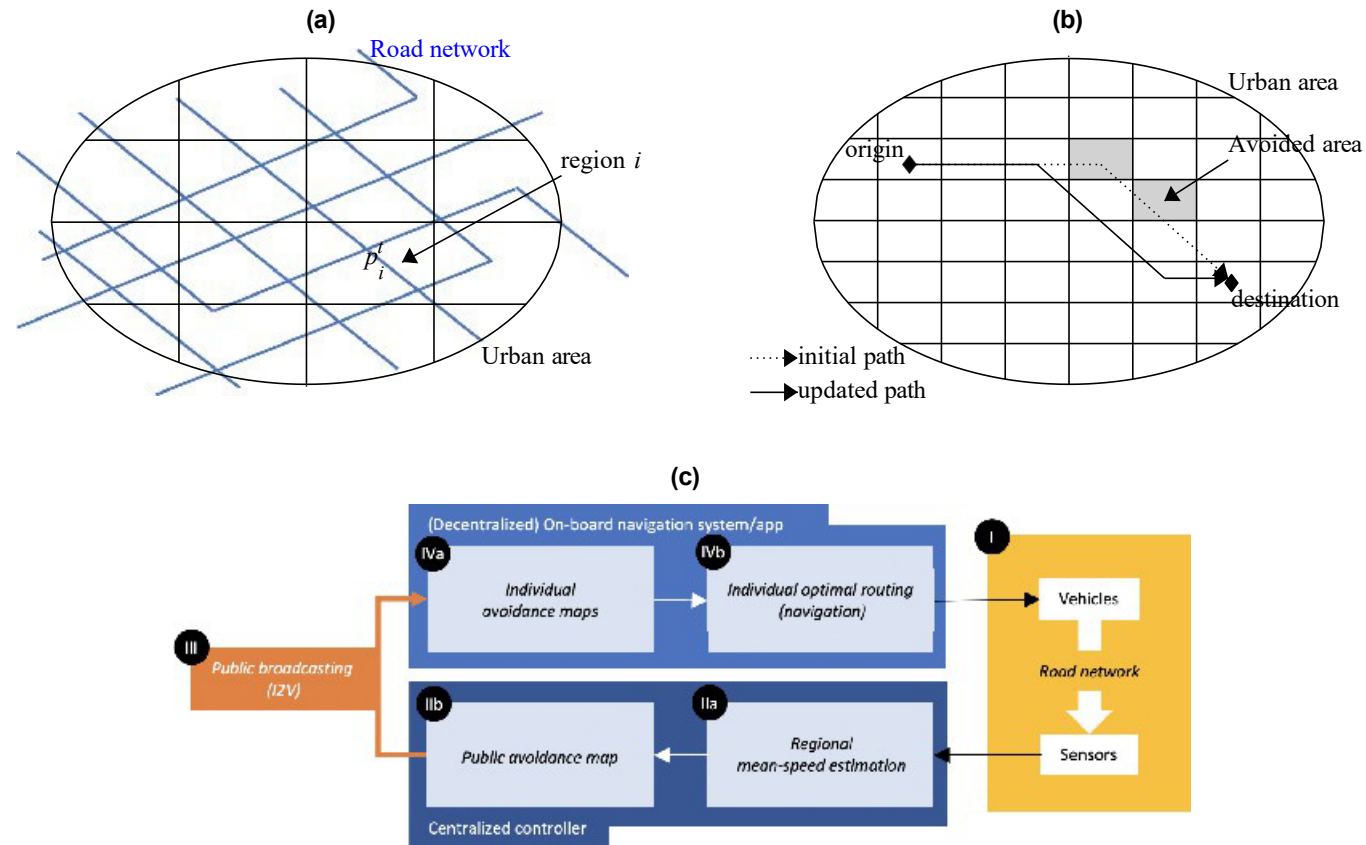

# Applications to resilient urban traffic management

# An optimal route guidance strategy based on avoidance maps

(Leclercq, L., Ladino, A., Becarie, C., 2021. Enforcing Optimal Routing Through Dynamic Avoidance Maps. *Transportation Research part B*, )

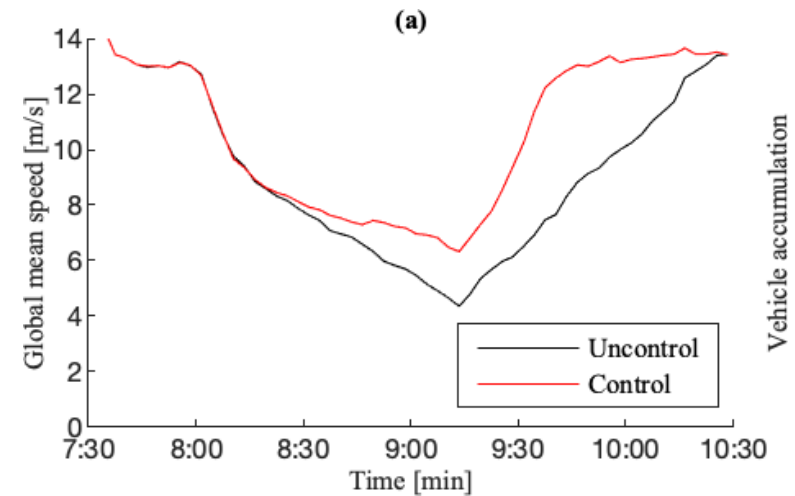

# Route guidance based on avoidance maps

# Simulation studies on a real network

Northern Lyon network

# Proof of concept – Lyon city

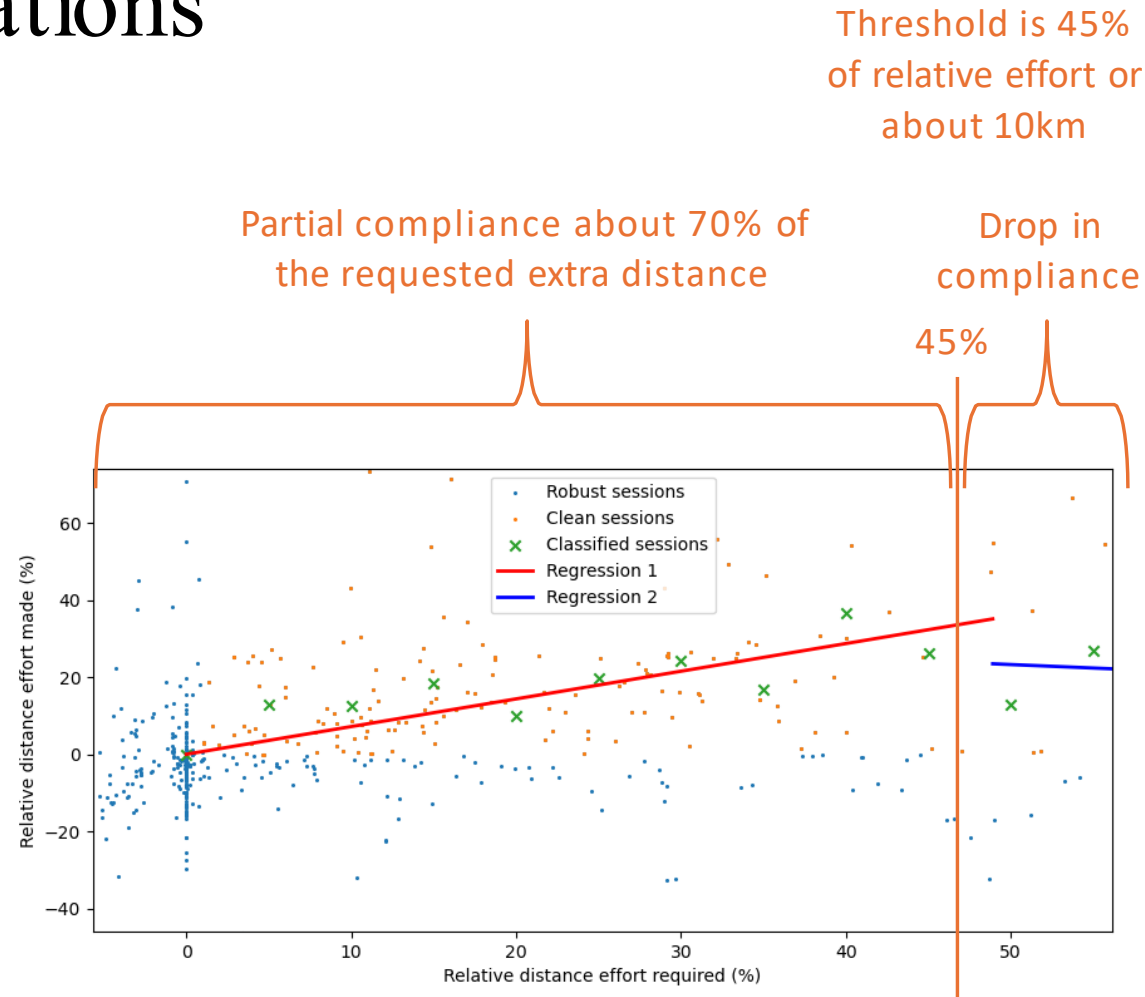

Lyon city has been partitioned in about 430 regions

ERC PoC MAGnUM+  
(prototype and first field tests)

# Behavioral observations

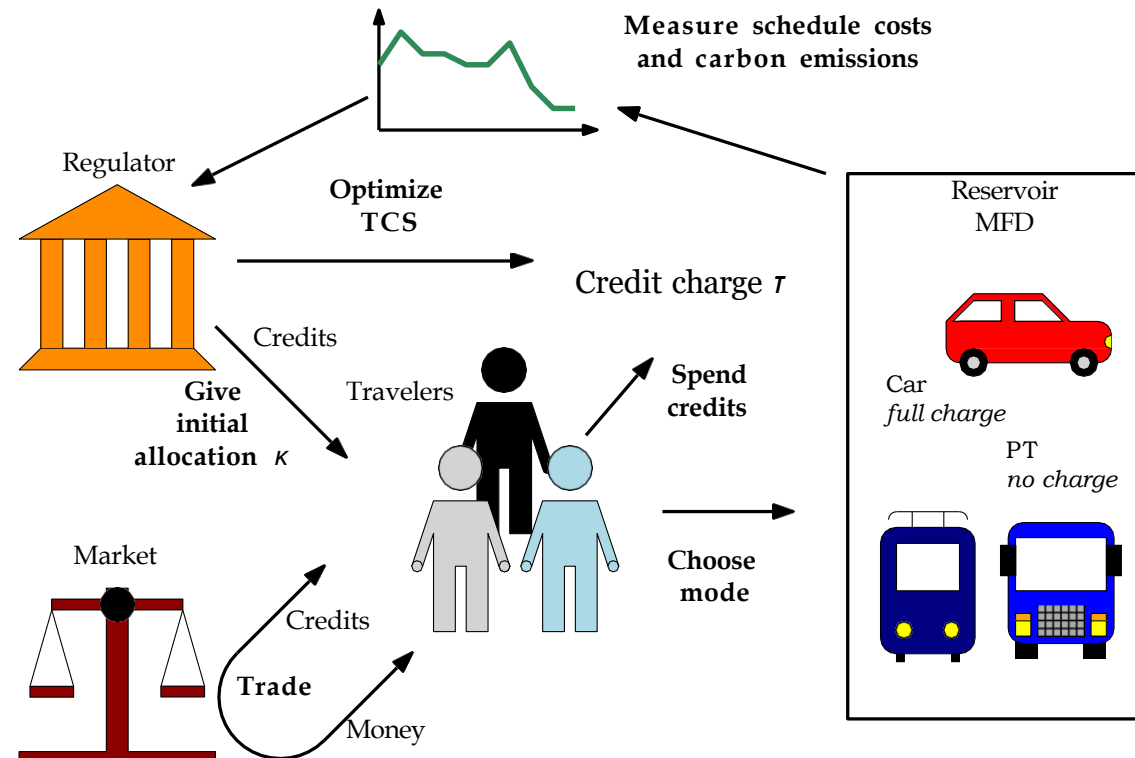

Overall distance in banned regions is reduced by 30% compared to the non-control case

# Managing demand with tradable credits

Balzer, L., Leclercq, L., 2022. Modal dynamic equilibrium under different demand management schemes *Transportation*.

Balzer, L., Leclercq, L., 2022. Modal equilibrium of a tradable credit scheme with a trip-based MFD and logit-based decision-making. *Transportation Research part C*, 139:103642

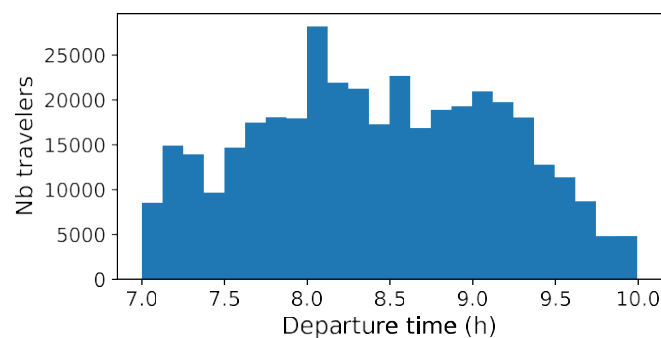

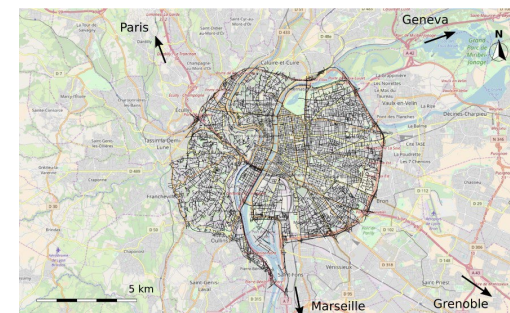

# Tradable Credit Scheme Concept

# Simulation settings

Mariotte et al. (2018)

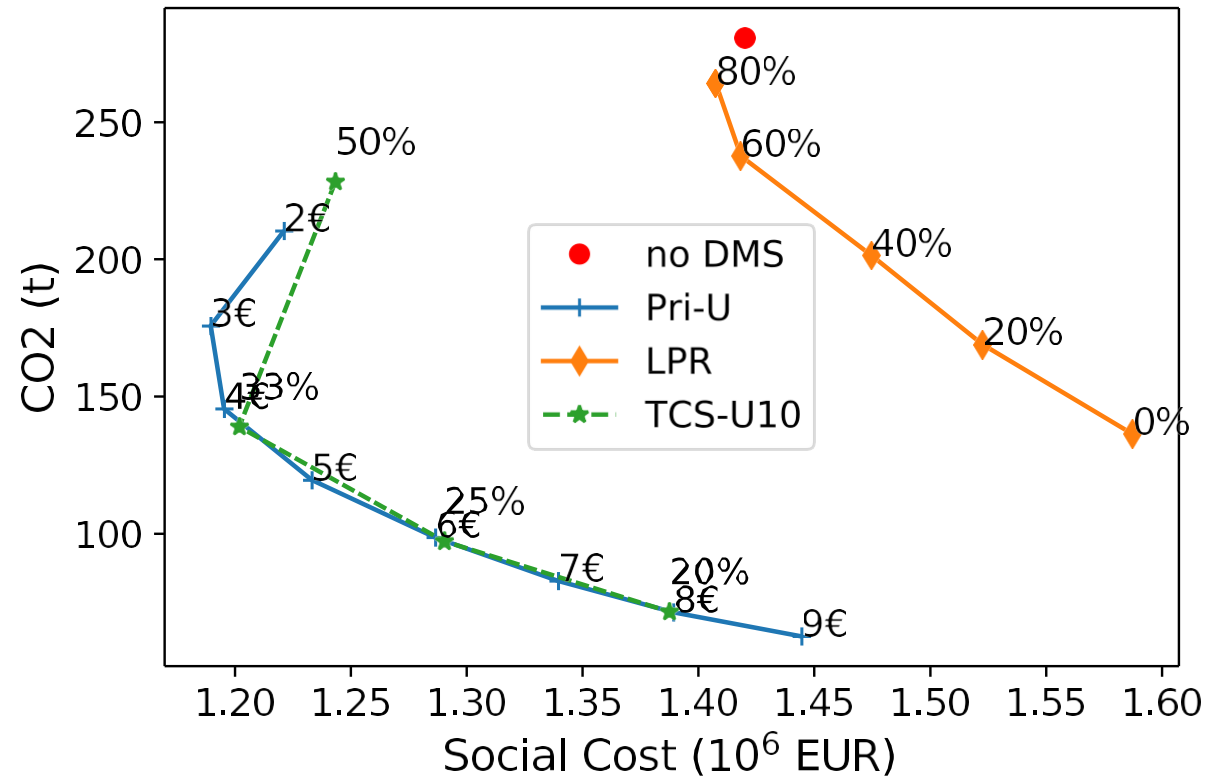

- Lyon Metropolis
- Morning commute 7:00 to 10:00
- Look over 10 days
- Credits **valid** two weeks
- No car on needed day → 10 EUR **penalty** (VoT = 10.8 EUR)

# Assessing different policies by simulation

- **License plate rationing:** every traveler is allowed to drive its car every two days, depending on the plate number (odd or even).
- **Congestion pricing:** additional price set by the regulator to drive a car.
- **Tradable credit scheme:** credits are required to travel by cars

# Pollution and congestion reduction for TCS, LPR, and pricing

# Satisfaction vs congestion reduction for TCS, LPR, and pricing
